

Hotfoil type FRP Tank Heating Panels

For use in hazardous, non-hazardous and corrosive environments

FRP Heating Panels are fiberglass laminates that are available in three standard sizes pre-molded to a general curvature. Standard voltages include 120 or 240volt but the panels can be manufactured to any practical voltage and are constant wattage.

The panel is a robust, completely waterproof, safe and reliable method of providing heat to new or existing storage tanks. This unique Factory Mutual Approved heater can be used on indoor and outdoor applications in hazardous, non-hazardous and highly corrosive environments.

FRP Panels are quick and simple to install, requiring no special tools or skills. Positioning is achieved by simply banding the heating panels to the tank. Installation of several heating panels takes only a few minutes to accomplish.
